Understanding the API Results

For `search` queries (such as: https://api.fda.gov/drug/event.json?search=receivedate:[20040101+TO+20081231]&limit=1), the `results` section includes matching adverse event reports returned by the API.

Each adverse event report consists of these major sections:

- **Header:** General information about the adverse event.
- **Patient Information:** Details on the patient who experienced the event, such as age, weight, sex, etc.
- **Drugs:** Information on the drugs taken while the event was experienced.
- **Reactions:** Information on the reactions experienced by the patient.

The order of these fields in the results can and will vary...

For `count` queries (such as: https://api.fda.gov/drug/event.json?count=patient.reaction.reactionmeddrapt.exact), the results section will look something like the following:

```
{
  "results": [
    {
      "term": "DRUG INEFFECTIVE",
      "count": 32584
    },
    {
      "term": "NAUSEA",
      "count": 27541
    },
    {
      "term": "FATIGUE",
      "count": 23341
    }
  ]
}
```
