Understanding the API Results

Understanding the API Results

For `search` queries (such as: https://api.fda.gov/drug/label.json?search=effective_date:[20040101+TO+20081231]&limit=1), the `results` section includes matching SPL reports returned by the API.

Each SPL report consists of these major sections:

- Standard SPL fields, including unique identifiers.
- Product-specific fields, the order and contents of which are unique to each product.
- **An openfda section:** An annotation with additional product identifiers, such as UPC and brand name, of the drug products listed in the labeling.

For `count` queries (such as: https://api.fda.gov/drug/label.json?count=openfda.product_type.exact), the results section will look something like the following:
