Northwind 2.0 Developer Edition: Products

Ala Arman

▶ *Applies To*

Select any topic below to learn more about **Products** in the Northwind Developer Edition.

Overview

Northwind 2.0 Developer Edition, **Products** includes a list form and detail form.

- To display the **Product List**, select **Products** on the ribbon.
- To view the **Product Detail**, select **Product ID** from the Product List.

Using Products

To view the status of a product use **Product List** features:

- Products with low inventory are highlighted in yellow.
- Discontinued products are shaded.
- **Add Product** button opens a new blank **Product Detail** form.
- Hyperlinks access the **Product Detail** form. Select a **Product ID** to view the **Product Detail**.

Programming Products

The Products List and the Product Detail form both display inventory information. Learn more in the Inventory topic.

frmProductList

Conditional formatting is used to highlight low product counts and to shade discontinued Products.

frmProductDetail

- Product Detail record source is a simple one-table query on Products.
- A combo box labeled "Go to Product" that runs the VBA procedure *cboFindProduct_AfterUpdate* to navigate to the selected record.
- VBA Sub *Calculate Levels* illustrates re-use of custom Functions and existing queries to set quantity textboxes (*Qty Available, Qty Allocated*, etc.), ensuring uniformity of the calculations throughout the application.
- Sub-forms on the tab control feature ***lazy loading***, meaning they are loaded only after the tab is clicked. This allows the **Product Detail** form to load faster, since subforms aren't loaded when the form opens.
- VBA sub *ControlStates* sets control properties depending on data values in the current record:
  - Visibility of the *Reorder Product* and *Delete Product* buttons, and *Orders* and *Purchase Orders* tabs.
  - Highlighting *Qty to Reorder* and its label (compare to ***conditional formatting***).
  - Form caption (what displays in the tab at the top of the form).
  - Field highlighting for missing data in required fields using ***Form Validation***.
- Uses ***Form Validation*** as explained in the Orders article within the Programming section.
- The form is designed to resize gracefully, using Anchoring: As the form is resized within the application, certain controls are set to anchor, and others to expand to fill the screen.
- **Equivalent Syntax**: VBA often allows alternate syntax to accomplish the same task. Uncomment and run each in turn to observe that they do the same thing.
- Command button ***Reorder Product*** (event *cmdReorderProduct_Click*) invokes a series of business rules to determine what happens next:

Was this information helpful?

```
    '====================Equivalent Syntax=========================
   CurrentDb.Execute "DELETE * FROM StockTake WHERE ProductID = " & Me.ProductID & ";"
'    DoCmd.RunSQL "DELETE * FROM StockTake WHERE ProductID = " & Me.ProductID & ";"
'    ==============================================================
```

  - Identifying the vendor for the purchase order
  - Appending a new line to an existing open purchase order, or creating a new purchase order
  - Setting a default reorder quantity

- A*djunct form frmDlgVendorPrompt* is called from the *cmdReorderProduct_Click* event, to prompt users to choose a vendor if the product has multiple vendors and none has an existing open purchase order. Its features include:
  - The default property for the form's "**OK**" button, *cmdOK*, is set to "*Yes*." This causes it to be activated when a user taps the **Enter** key.
  - The form's "Cancel" button, **cmdCancel**, has its Cancel property set to "*Yes*." This means it is activated when the user taps the **Esc** key.
  - The form is called using acDialog Window Mode. This ensures that users cannot interact with other forms while the form in dialog mode is open, and that VBA code running in the calling procedure will stop until the dialog is hidden or dismissed.
  - If canceled, *frmDlgVendorPrompt* closes, and the *frmProductDetail* procedure *cmdReorderProduct_Click* reactivates, then exits.
- If a Vendor is selected, *frmDlgVendorPrompt* hides itself. This allows code to progress in the calling procedure in *frmProductDetail*, which reads the value of the Vendor selection on the (now hidden) *frmDlgVendorPrompt*, then closes the form and proceeds to create a new Purchase Order for the identified Vendor.
